

BILE ESCULIN AGAR (5 ML)

INTENDED USE:

A differential medium for the isolation and presumptive identification of enterococci / Group D streptococci.

PRINCIPLE AND INTERPRETATION:

The major use of Bile Aesculin Agar is to differentiate between enterococci / Group D streptococci and non Group D streptococci. It may also be used for the presumptive identification of other groups of organisms.

Enterococci / Group D streptococci hydrolyse aesculin to form aesculetin and dextrose. Aesculetin combines with ferric citrate in the medium to form a dark brown or black complex which is indicative of a positive result. Bile salts will inhibit Gram-positive bacteria other than enterococci / Group D streptococci.

The value of bile tolerance together with hydrolysis of aesculin as a means of presumptively identifying enterococci / Group D streptococci is widely recognised.^{1,2,3,4,5}

The use of these parameters forms the basis of Bile Aesculin Agar and was described by Swan⁶ who concluded that the use of this medium is a valid alternative to Lancefield grouping for the recognition of enterococci / Group D streptococci.

Facklam⁷ further confirmed its usefulness in differentiating enterococci / Group D streptococci from non Group D streptococci while other workers have used the medium for presumptive identification of the Klebsiella-Enterobacter- Serratia group amongst the Enterobacteriaceae^{8,9,10}

COMPOSITION:

Ingredients	Gr/Liter
Peptone	14 gr
Bile salts	15 gr
Ferric citrate	0,5 gr
Aesculin	1 gr
Agar	14 gr

***Formula adjusted, standardized to suit performance parameters

pH: 7,1 ± 0,2

PRECAUTIONS:

For professional use only. Do not use tubes if they show evidence of microbial contamination, discoloration or other signs of deterioration.

TEST PROCEDURE:

Using a sterile loop inoculate the medium with 4-5 colonies and incubate at 37°C for 18-24 hours. The result is positive for bile salt tolerance and aesculin hydrolysis if blackening of the medium occurs.

QUALITY CONTROL:

1.Sterility Control:

Incubation 48 hours at 30-35°C and 72 hours at 20-25°C: NO GROWTH

2.Physical/Chemical Control

pH: 7,1 ± 0,2

Appearance: Dark olive green, with a blue tint

3.Microbiological Control: Incubation at 37 °C during 48-72 h.

Microorganism	Inoculum (CFU)	Results	
		Growth	Reaction
Enterococcus faecalis ATCC 29212	10-100	Growth	Good growth; brown coloured colonies with aesculin hydrolysis
Enterobacter aerogenes ATCC 13048	10-100	Growth	Good growth; brown coloured colonies with aesculin hydrolysis
Streptococcus pyogenes ATCC 19615	100-1000	No growth	-

RTA.KK.180 Revision Date/Revision Number:-/0 Issue Date: 07.11.2016

STORAGE CONDITIONS AND SHELF LIFE:

Store the medium at 2 - 12°C. Use before expiry date on the label. Do not use beyond stated expiry date.

DISPOSAL:

Incubated medium may contain active bacteria and micro-organisms. Do not open infected medium. Infected medium should be autoclaved, incinerated or opened and soaked in a chlorine-based disinfectant (liquid bleach) for 20 minutes prior to disposal.

PACKAGING:

Katalog Number: 01058

Content / Packaging: 100 Tubes/Box
